OVERVIEW

Modern database management systems built on SQL technology are the foundation for company's data warehouse environment and play an important role in day-to-day business operations. Such environments need a solution that simplifies management process and increases database administrator productivity. Although organizations can install and use the DBMS as delivered, often the functionality needed to adequately support database development and maintenance is not provided by the DBMS product alone. Concepts of database management maintain the focus on real-world cases such as database design, data integrity, concurrent updates, data security and many other issues. With the help of the appropriate database tools a DB developer can reduce errors, speed up the complex work of analyzing, designing and implementing database applications. Specialized DBA tools will help reduce the costs associated with implementing efficient database administration.
